

What is your project about, who is it for, what does it do.

Share information about traditional Japanese food

The website is about traditional Japanese food.

This website will show different types of Japanese meals with and introduce the common meals categorised in 5 bases. The website will show images of the meals and let the user pick whatever they like or have interest in. Then it shows the details such as description, ingredients, and price of each meal. This is for the people who like Japan, and the Japanese food culture.

Before

After

In the database diagram, I have added the relationships to represent many to many relationships between each table. The lines and arrows connect two tables and tell us that things from one table can connect to things in another table, and vice versa.

Website layout and design including fonts & colours

Layout:

The website will have a clear and simple layout with easy navigations.

design:

The website is about Japanese food, so I will design the webpage to make it relate to Japan and Japanese food culture.

Show different meals with pictures and description

colour:

I'll make the colour of the website easy to see and make it relate to Japan. I will use a simple colour for my background and make it accurate by considering the combination of colours.

Feedback from other people.

What is the part in my website you think could be improved?	What I changed.
There should be a more accurate background colour for each page, and better designs, size. The design is currently poor and doesn't look like this is related to Japan.	I made some improvements for my design, mainly the background for each page in my document. I change the background colour so that it relates to Japanese culture and food. I used several colours and used combinations of colour to make it look more accurate for each page in my website.
The font size for each pages is quite different and it is not accurate.	I adjusted the font size to improve the visual and make it easier to read. I made the h1 big and clearly showing on the top middle of the page so the user can know what the page is about.
The nav bar should have colour and the design could be improved.	I made the nav bar look better. I changed the colour considering the relation to the Japanese culture and other colours used in the page. I also changed the footer background colour that matched the background of the main part for each page. I made the footer very simple and clear by not containing lots of information and made it look good.
The navigation could be improved. Nav bar can be improved. It will be good if the images or the links that I can click on are more obvious.	I added a hover effect for many places such as each section for the nav bar, meal images that are clickable, and the meal names. This ensures that the user recognises the parts in the website that are clickable and not.

Content layout of the meals are a little bit confusing on all Japanese food pages.	To make the meal images in the "All Japanese Food" section look better, I put each meal inside a box-shaped container. Inside that box, I added the name of the meal, so you can easily tell what each meal is just by looking at it. This makes it much clearer and more organised for anyone browsing through the Japanese food options on the website. Also, I changed the layout of the Japanese food page where it shows up when you click on the image of the meal. It contains detailed information in it and it was challenging because the length of each meal's information differs. So I made the details display in the middle of the page.

Deep fried food

Description:

Japanese deep-fried food is called "Tempura." It involves coating fresh ingredients like seafood and vegetables in a light batter and frying them until crispy. Tempura is served with a dipping sauce called "teriyaki" and is loved for its delicious taste and appealing presentation. It's a popular dish enjoyed by both locals and visitors to Japan.

Relevant implications.

- Future proofing

One of the main strengths of my Japanese food website is its future proof design. This means that this website is not just a static collection of Japanese food images and information. It's built to seamlessly accommodate growth and change. The website can easily grow and add more meals. Users can get the latest information on Japanese meals. Instead of fixed content, the site uses a system that allows easy updates. New Japanese meals, images, and descriptions can be added quickly. So, the menu changes could be always up to date. Therefore my Japanese food website is future-proof, allowing us to make quick changes and additions to enhance the user experience.

- cultural

This Japanese food website respects and celebrates Japanese culture. I wanted to convey the importance of Japanese food and its culture. I'm from Japan, so I took the opportunity to learn more about traditional cuisine and the dishes that Japanese people often eat. My website is not only about food, but also about sharing Japan's rich culture. The goal of this website is for you to learn about Japan's cultural heritage while enjoying delicious food. I am dedicated to preserving and sharing Japanese culture through our site, and providing fun and educational experiences for people who love Japan.

HCI -

- Visibility of system status;

On my website, I aimed to keep things clear and easy to understand for users. I made sure that the elements indicating what's happening are visible and easily recognizable. So, the users can quickly understand where they are on the website and what actions they can take.

- Aesthetic and minimalist design;

I wanted my website to have a simple appearance, related to the attractive way Japanese food is presented. I focused on showing 20 well-known Japanese meals and kept the design as simple as possible. Users can click on a meal that is clearly represented on the page to get the information about it without any distractions.
